

## METHOD AND SYSTEM FOR ENHANCED PACKET TRANSMISSION IN CELLULAR NETWORKS

### Abstract of the Disclosure

QoS scheduling is used for handling multiple data flows in packet switched  
5 cellular systems, especially in a packet switched mobile telecommunication system,  
wherein the scheduling mechanism of a specific cell is coupled with the scheduling  
mechanism of at least one second cell, in particular by transferring data between the  
specific cell and at least one second cell comprising a status information concerning  
data flow within the specific cell.
